NOTE

1. Surge Voltage

> Absolute maximum voltage, non-repetitive. The duration must not exceed 1 second.

2. Rated Capacitance (Measurement Method)

> Constant current charge with 4CV [mA] to V_R .
e.g. In case of 150V-6F module, $4 \times 6 \times 150 = 3,600mA = 3.6A$
> Constant voltage charge at V_R for 5 min.
> Constant current discharge with 4CV [mA] to 24V.

$$C = \frac{I \times (t_2 - t_1)}{v_1 - v_2}$$

where C is the capacitance (F);
 I is the absolute value of the discharge current (A);
 v_1 is the measurement starting voltage, $0.8 \times V_R$ (V);
 v_2 is the measurement end voltage, $0.4 \times V_R$ (V);
 t_1 is the time from discharge start to reach v_1 (s);
 t_2 is the time from discharge start to reach v_2 (s)

3. Initial DC-ESR (Measurement Method)

> Constant current charge with 4CV [mA] to V_R .
> Constant voltage charge at V_R for 5 min.
> Constant current discharge with 40CV [mA] to 140V.
e.g. In case of 150V-6F module, $40 \times 6 \times 150 = 36,000mA = 36A$

$$ESR_{DC} = \frac{\Delta v}{I}$$

where ESR_{DC} is the DC-ESR (Ω);
 Δv is the voltage drop during first 10ms of discharge (V);
 I is the absolute value of the discharge current (A)

4. Average

> Typical value or percentage spread that may be present in one shipment

5. Typical Leakage Current (Measurement Method)

> Typical leakage current of the module is the sum of the leakage current of the cell (measured at the rated voltage and at room temperature after 72 hours) and the bypass current created by the balancing circuit.

6. Maximum Peak Current

> Current that can be used for 1-second discharging from the rated voltage to the half rated voltage under the constant current discharge mode

$$I = \frac{\frac{1}{2}V_R}{\Delta t / C + ESR_{DC}}$$

where I is the maximum peak current (A);
 V_R is the rated voltage (V);
 Δt is the discharge time (sec); $\Delta t = 1$ sec in this case;
 C is the rated capacitance (F);
 ESR_{DC} is the maximum DC-ESR (Ω)

> The stated maximum peak current should **not** be used in normal operation and is only provided as a reference value.

7. Energy & Power (Based on IEC 62391-2)

> Maximum Stored Energy, E_{max} (Wh) = $\frac{\frac{1}{2}CV_R^2}{3600}$

> Gravimetric Specific Energy (Wh/kg) = $\frac{E_{Max}}{Weight}$

> Usable Specific Power (W/kg) = $\frac{0.12V_R^2}{ESR_{DC} \times Weight}$

> Impedance Match Specific Power (W/kg) = $\frac{0.25V_R^2}{ESR_{DC} \times Weight}$

8. DC Life and Cycle Life Test

> End-of-Life Conditions:
- Capacitance: -20% from the minimum rated value
- DC-ESR: +100% from the maximum specified initial value
> Capacitance and ESR measurements are taken at $25 \pm 10^\circ C$

9. Usable Continuous Current

> Maximum current which can be used within the allowed temperature range under the constant current discharging mode

$$I = \sqrt{\frac{\Delta T}{R_{th} \times ESR_{DC}}}$$

where I is the maximum continuous current (A);
 ΔT is the change in temperature ($^\circ C$);
 R_{th} is the thermal resistance ($^\circ C/W$);
 ESR_{DC} is the DC-ESR (Ω)
